

Explain the decision. Defend the assumptions.

Five-minute walkthrough

0-1 min: Introduce the five-unit Rp30bn asset package and Rp21bn financing request.

1-2 min: Walk from billed hours to EBITDA, cash tax, maintenance capex, CFADS and base DSCR 1.39x.

2-3 min: Apply downside; coverage falls to 0.96x. Explain why a healthy base case is insufficient.

3-4 min: Resize to Rp16bn; downside becomes 1.26x, yet first-year coverage after collection delay is only 1.00x.

Distinguish solvency from liquidity.

4-5 min: Close with conditional structure, missing evidence, project survey and monthly monitoring.

Positioning

My background is in engineering and data analysis. I built this independent equipment-finance case to show how I translate operating assumptions into a credit decision. I am moving into credit analysis; this is a learning project, not a loan I approved.

Bahasa Indonesia - rekomendasi

Saya tidak akan merekomendasikan pembiayaan Rp21 miliar hanya karena DSCR base case mencapai 1,39 kali. Pada skenario downside, DSCR turun menjadi 0,96 kali. Saya akan mengevaluasi plafon Rp16 miliar, dengan verifikasi kontrak, sumber modal, arus kas, dan perlindungan likuiditas.

DSCR yang cukup belum menjamin likuiditas aman. Ketika pembayaran customer melambat, kebutuhan modal kerja naik. Pada plafon Rp16 miliar, DSCR downside tahun pertama hanya sekitar 1,00 kali setelah tambahan piutang. Dana cadangan dan sumber likuiditas perlu diuji secara terpisah.

Questions to be ready for

Why not approve when base DSCR exceeds 1.25x?

The borrower must survive plausible stress. Utilization and fuel assumptions erode cash flow; collection timing can consume liquidity even when annual operations are profitable.

Why Rp16bn instead of Rp18.38bn?

Rp18.38bn is the algebraic downside maximum at a 1.10x floor. Rp16bn provides an additional judgmental buffer and roughly meets 1.25x steady-state downside coverage. It remains subject to verification.

Why is EBITDA not repayment cash?

Taxes, maintenance capex and working capital consume cash. Interest and principal are debt service. I avoid counting EBITDA as free cash flow.

How would you evaluate existing corporate debt?

Obtain a full debt schedule, guarantees, leases and contingent obligations; calculate consolidated CFADS and aggregate debt service. Project-only DSCR here cannot establish corporate capacity.

Why use Brent for a mining contractor?

It illustrates fuel-cost cyclicalities. I do not infer coal prices or diesel invoices from Brent. I would request actual fuel invoices and check pass-through in the project contract.

How reliable is the PD?

It is uncalibrated and illustrative. I would use the lender-approved rating framework, verified repayment data, validation and documented overrides.

What happens during a project visit?

Verify equipment suitability, actual hours and maintenance logs; meet site management; check contract scope, permits, safety, access and backup work. Cross-check statements against operating evidence.

How do you work with Marketing?

Maintain a clear document request list, deadlines and unresolved issues. Explain which evidence is required for the decision; remain collaborative while preserving independent credit judgment.

What would make you decline?

Unverifiable or unstable contracts, weak payer credit, unexplained cash-flow discrepancies, insufficient fresh equity, legal security problems or unacceptable stress capacity.

What is your biggest learning gap?

I am building practical financial-statement and credit-process experience. I bring engineering and quantitative discipline, and I would learn the lender policy, systems and field practice from the team.

Before the interview

Practice the five-minute case twice. Open the live site and keep the PDF offline. Use the scenario lab to show the Rp21bn downside, then the Rp16bn downside. Be explicit about assumptions and missing data. Ask about KAF credit process, project surveys, escalation and portfolio monitoring.
